IMPORTANT: PLEASE NOTE

REMOTE KEYLESS ENTRY (CENTRAL LOCKING) IS FITTED TO YOUR NEW L200 GST PLUS CANOPY.

THE REAR DOOR HANDLE WILL ONLY OPERATE ONCE THE CENTRAL LOCKING IS ACTIVATED. THEREAFTER THE HANDLE MUST REMAIN IN THE LOCKED POSITION IN ORDER FOR THE CENTRAL LOCKING TO WORK.

PLEASE KEEP THE INSTALLATION MANUAL WITH THE VEHICLE.

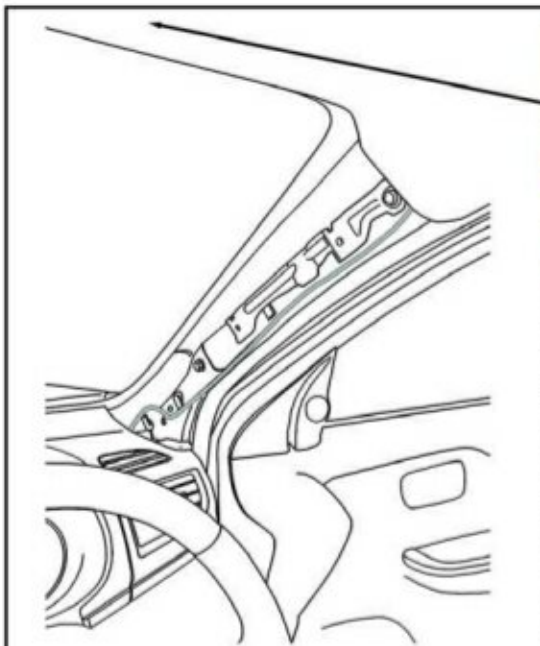

The wiring has been updated (3rd Generation). The GST+ canopy features the wired canopy interior lamp found on the Generation 2 wiring. The canopy interior lamp is now activated if any of the vehicle doors or canopy door are open. If the canopy door is opened it will also activate the vehicle interior lights. This function also prevents the vehicle and canopy from self locking if either door or canopy tailgate is open. Additionally if the vehicle alarm is armed and the canopy tailgate door is opened the siren will trigger.

The new lighting plugs attach to the front most interior lamp of the vehicle. The below plugs attach to the drivers side door switch. This makes the door switch on the canopy act as if it was a vehicle door switch so when open will activate the interior lights, show that a door is open on the dashboard and will prevent the vehicle from self locking or from being locked accidentally.

Drivers Side Door

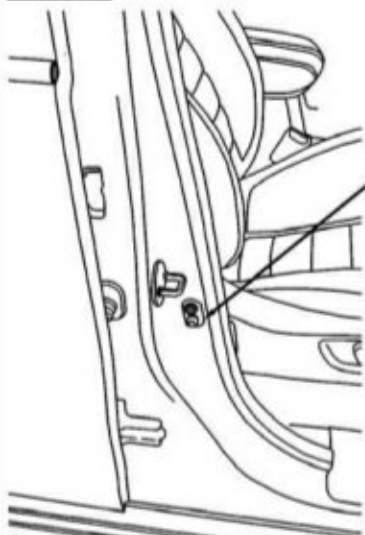

Detail A

Remove grab handle and trim from the drivers side A pillar via two screws located behind the caps on the grab handle. Remove the front interior light unit via 3 screws and disconnect the light. Route the canopy wiring loom from drivers footwell up through the A pillar, behind the head lining of the vehicle and into the area where the front interior light unit sits. Plug one end of the canopy wiring loom into the light unit and the other into the plug on the vehicle wiring loom. Replace the interior light, secure the wiring on the A pillar before replacing the trim and grab handle.

Detail B

Disconnect plug from drivers side door switch and connect shown plugs on canopy wiring loom into the door switch and the removed plug on the vehicle wiring loom.

Detail C

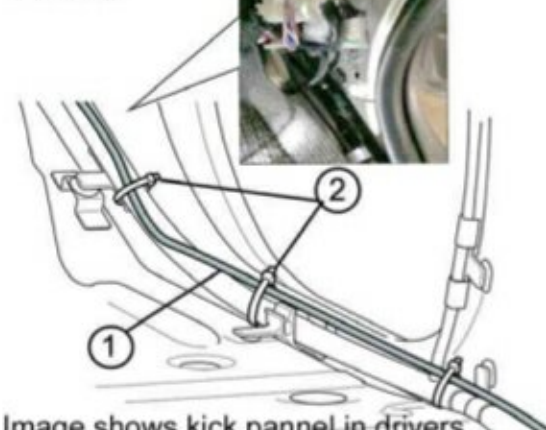

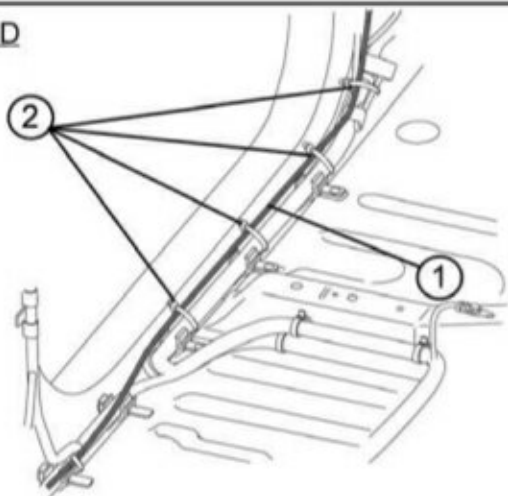

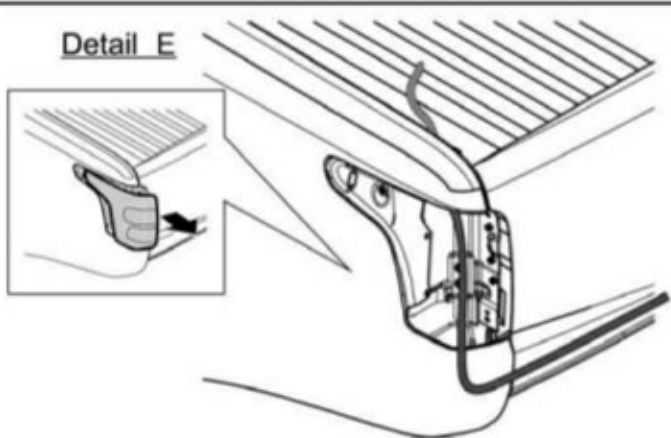

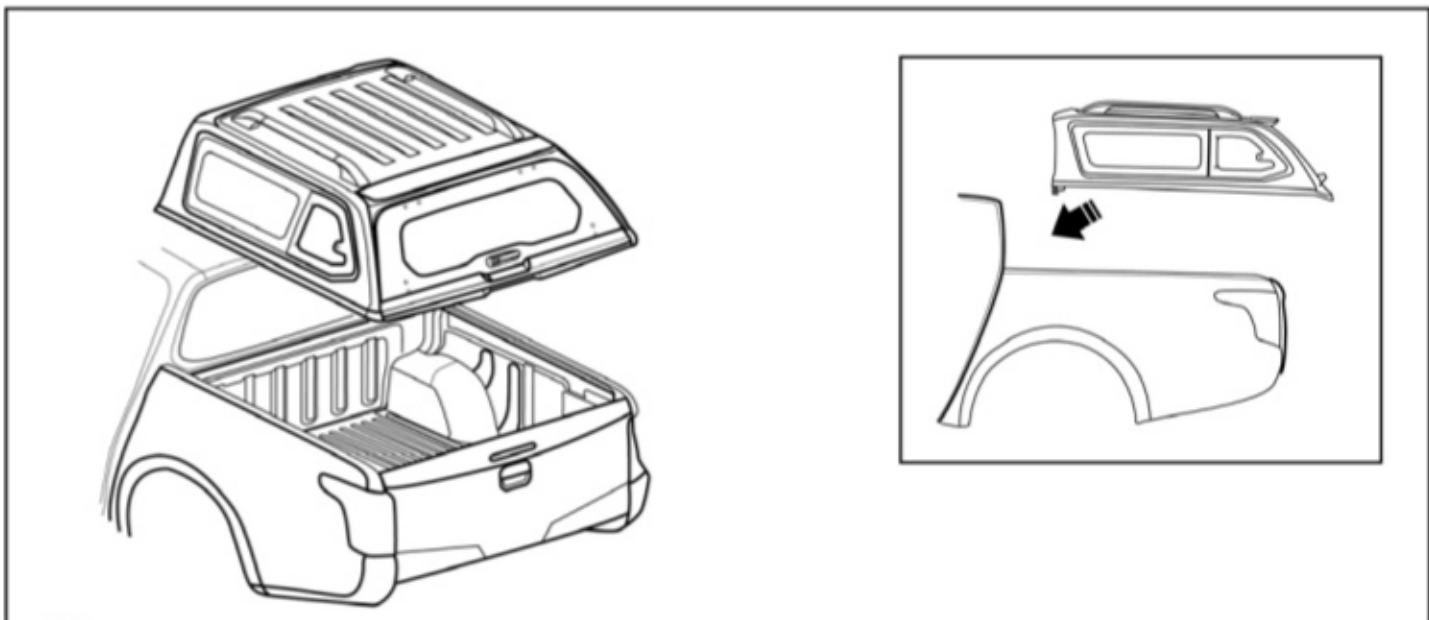

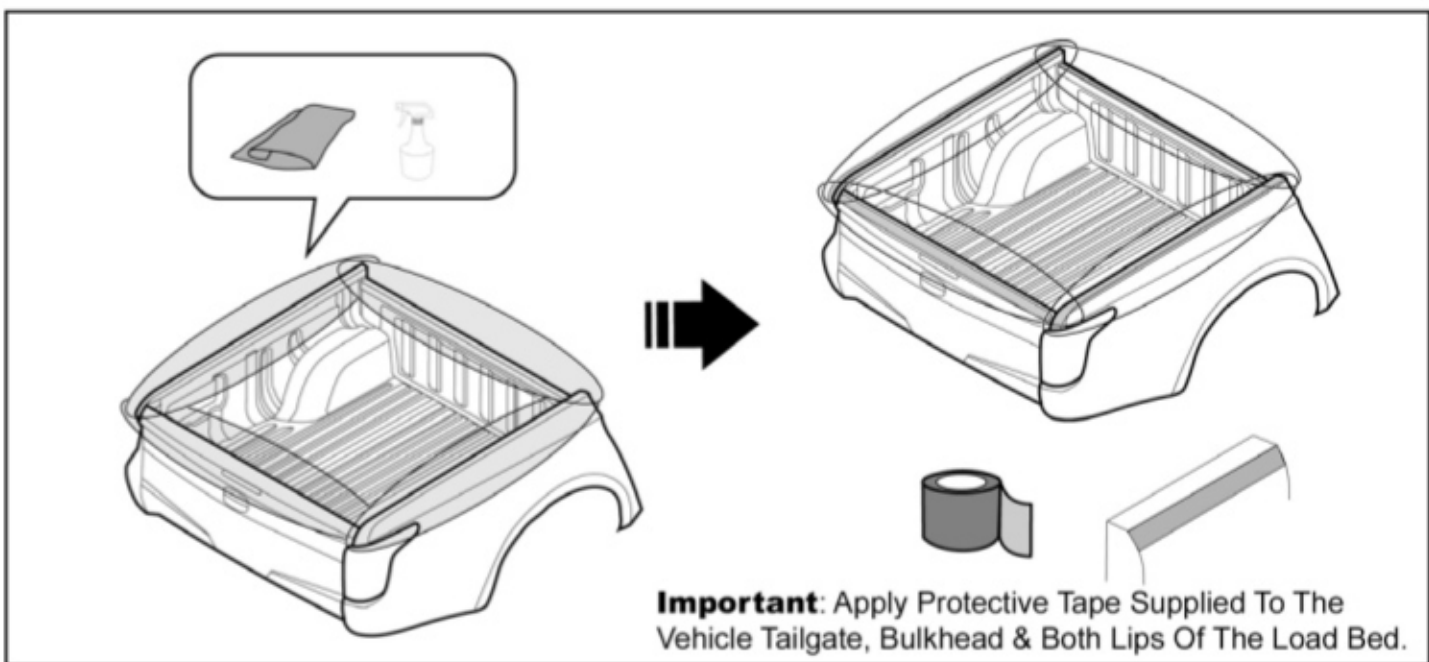

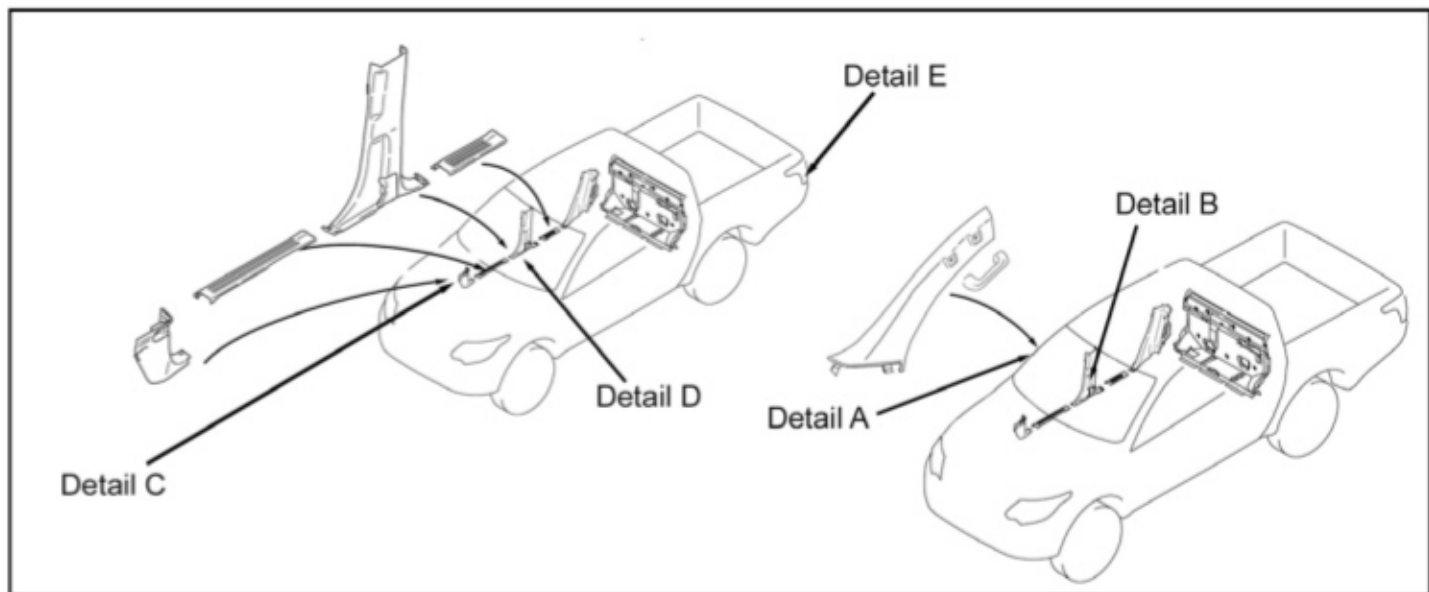

Image shows kick panel in drivers footwell, remote locking signal is picked up here. Secure under internal sill plastics as shown.

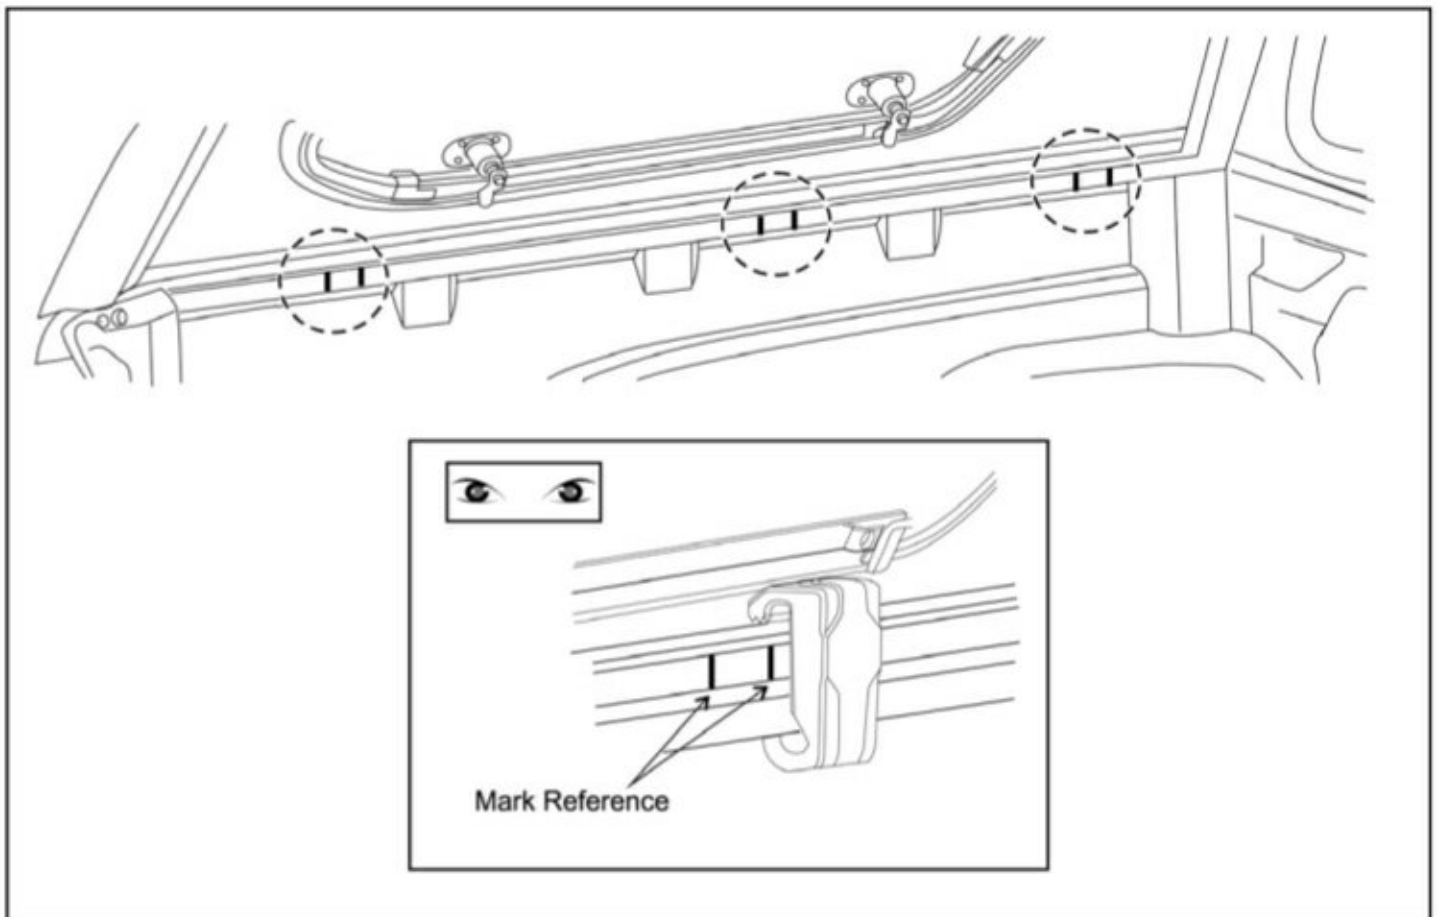

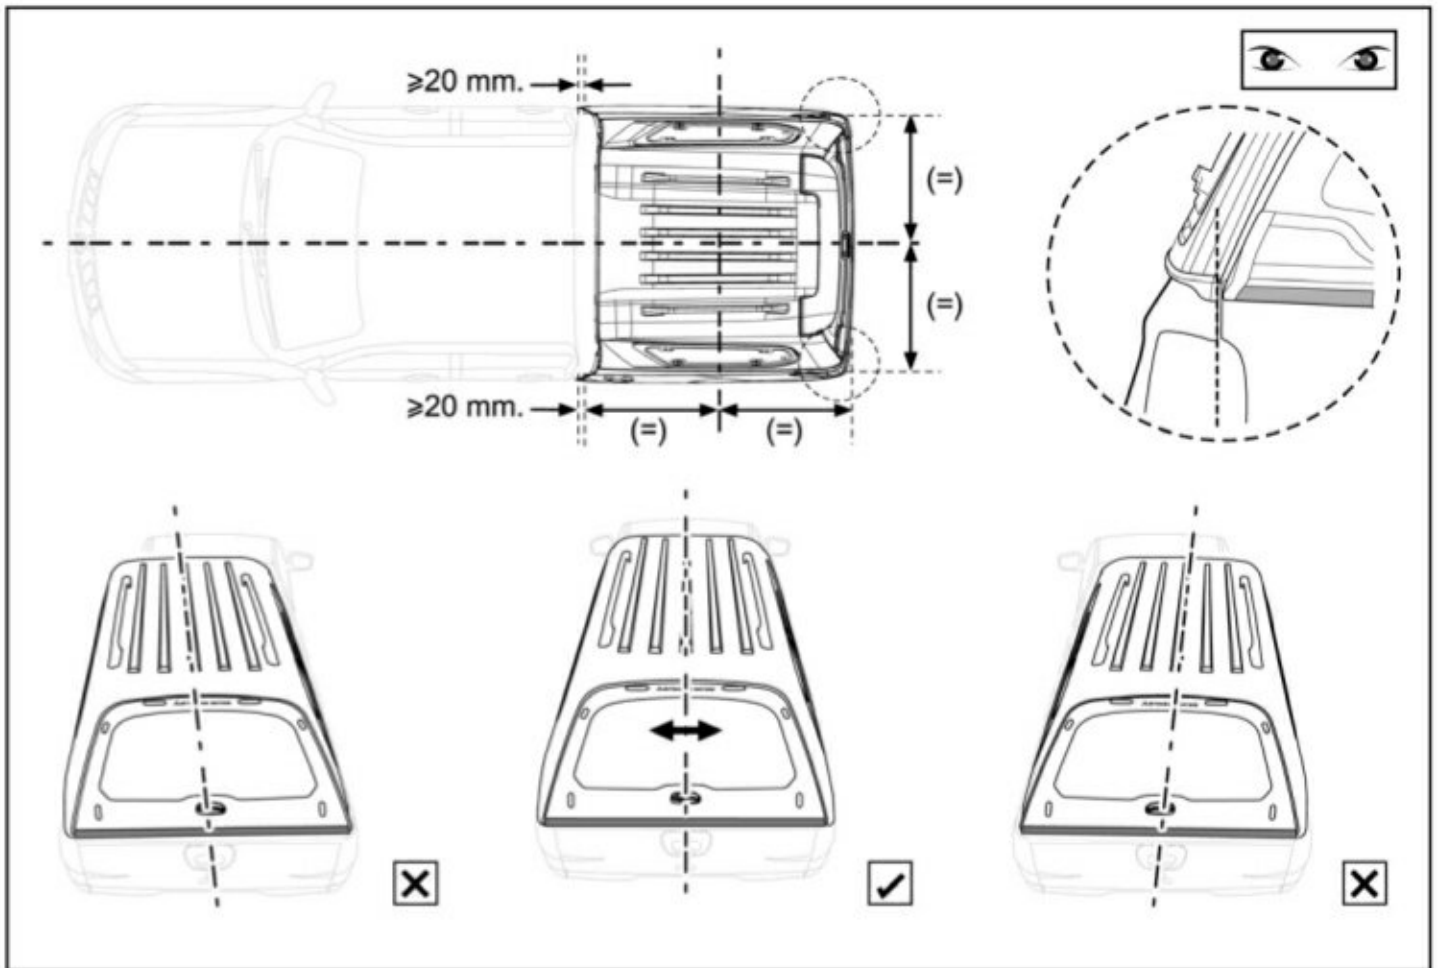

Detail D

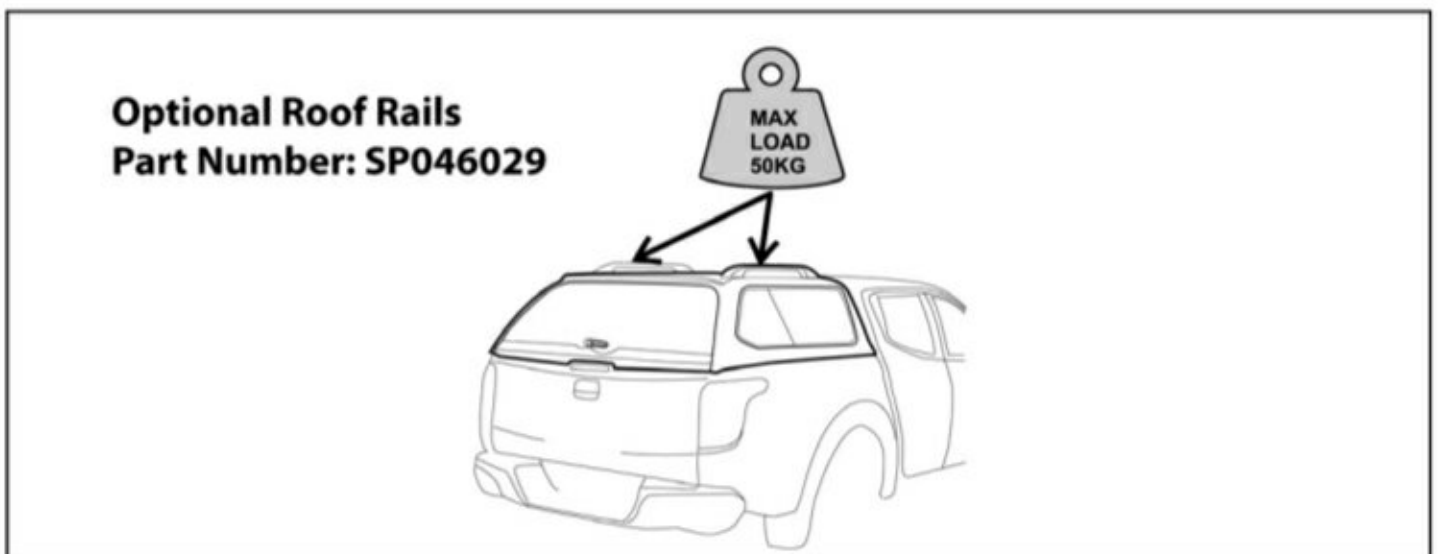

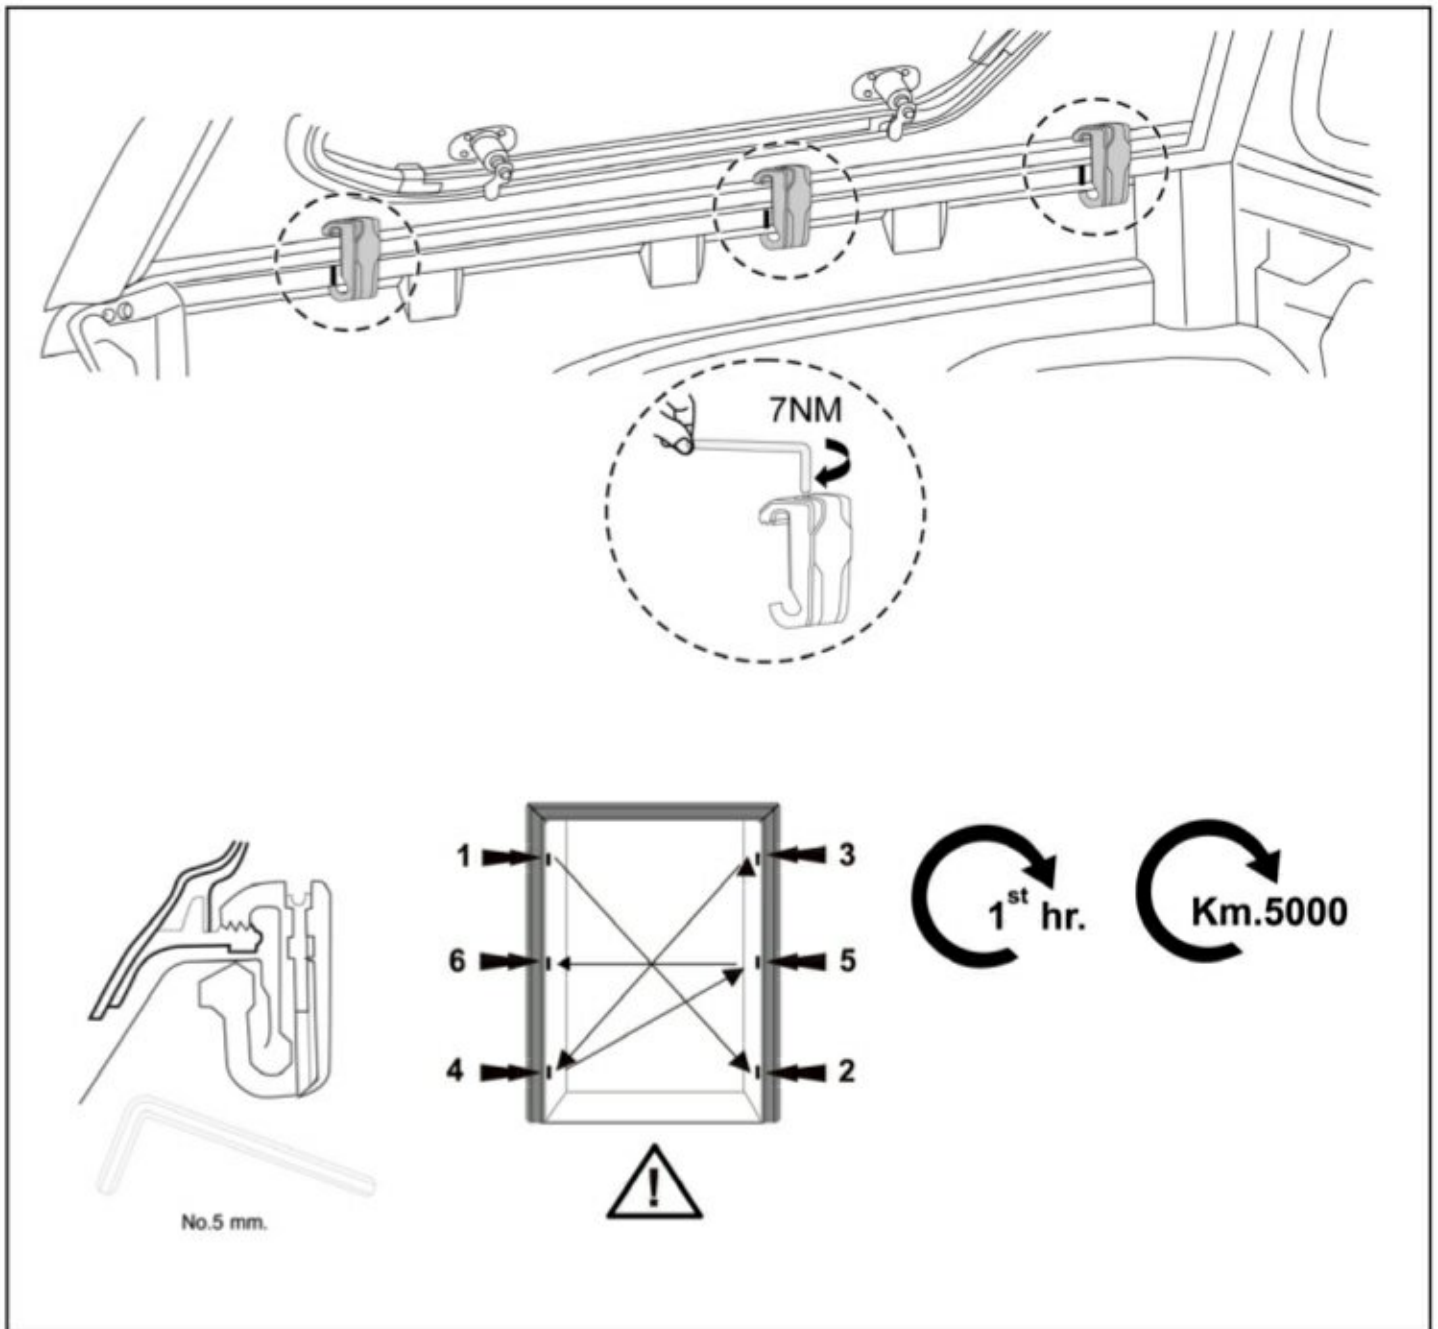

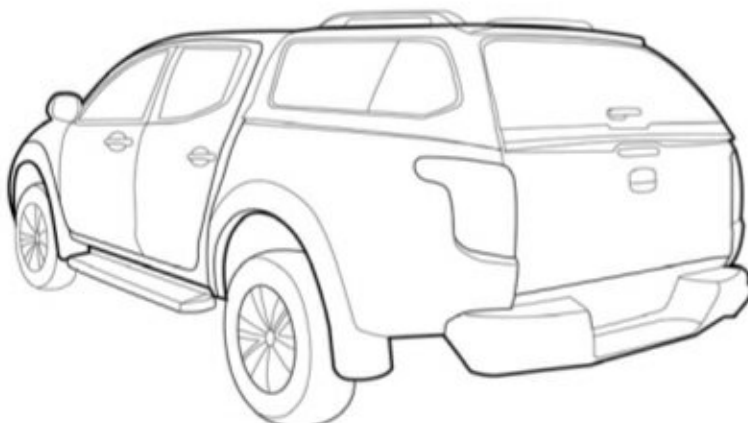

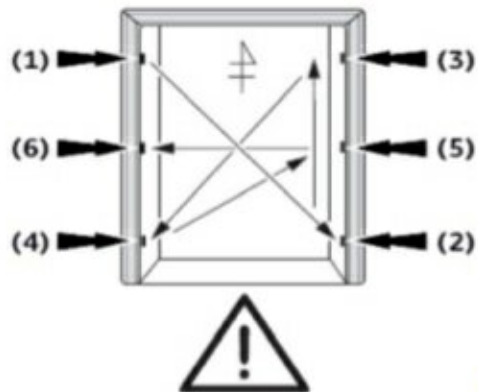

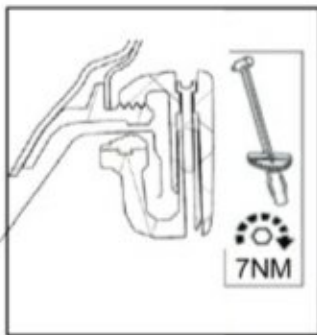

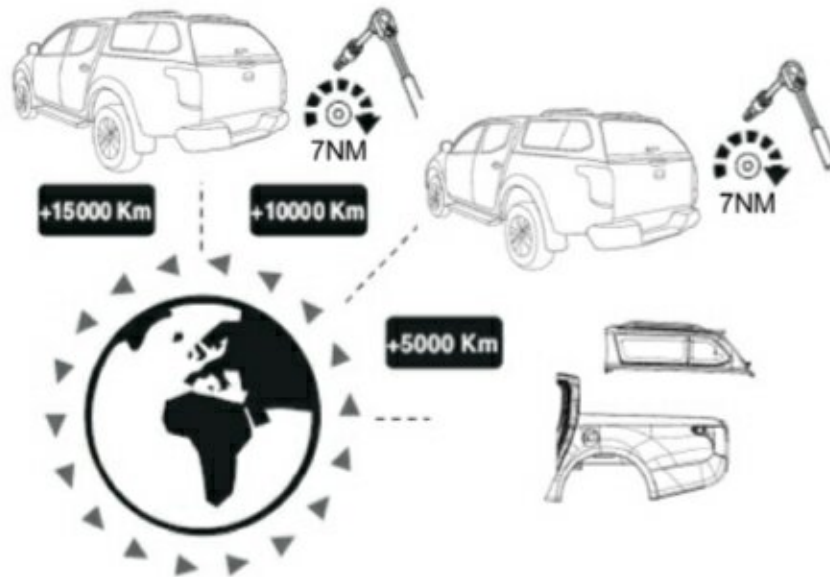

Detail E

Optional roof bar kit - SP046029 (Order separately)

Offer up the brushed alloy extrusion to the moulded void within the canopy roof, centralise and drill through the existing four holes using a 9.5mm drill (The inner alloy extrusion is the internal loading bearing structure)

Apply a thin bead of silicone externally on the painted roof skin around the drilled hole.

Offer up the roof bars externally and fix through from the inside using the supplied 8No M8 stainless steel cap screws - 6mm allen key This operation requires an additional person for 5-minutes. Torque to 7NM.

Final operation is fitting the internal ABS 'Snap' cover to cover the internal structure.
